Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Application No. Applicant(s) 10/517.569 PALLENBERG ET AL. Office Action Summary Examiner Art Unit MAURY AUDET 1654 -- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --Period for Reply A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS. WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION. Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b). Status 1) Responsive to communication(s) filed on 04 May 2009. 2a) This action is FINAL. 2b) This action is non-final. 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under Ex parte Quayle, 1935 C.D. 11, 453 O.G. 213. Disposition of Claims 4) Claim(s) 1-64 is/are pending in the application. 4a) Of the above claim(s) _____ is/are withdrawn from consideration. 5) Claim(s) _____ is/are allowed. 6) Claim(s) 1-64 is/are rejected. 7) Claim(s) _____ is/are objected to. 8) Claim(s) _____ are subject to restriction and/or election requirement. Application Papers 9) The specification is objected to by the Examiner. 10) ☐ The drawing(s) filed on is/are: a) ☐ accepted or b) ☐ objected to by the Examiner. Applicant may not request that any objection to the drawing(s) be held in abevance. See 37 CFR 1.85(a). Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d). 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152. Priority under 35 U.S.C. § 119 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f). a) All b) Some * c) None of: Certified copies of the priority documents have been received. 2. Certified copies of the priority documents have been received in Application No. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)). * See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Election/Restrictions

Applicant's election without traverse of the following 3 species:

- 1) flourophore or photosensitizer (CHLORIN); bound to any agent that function as a
- quenching agent (BETA CAROTENE/CAROTENOID); bound to any agent that can function as a
 - 3) targeting moiety (ANTIBODY).

in the reply filed on 5/4/09 is acknowledged.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1-64 rejected under 35 U.S.C. 103(a) as being unpatentable over Singh (20020197649).

Application/Control Number: 10/517,569 Page 3

Art Unit: 1654

Singh teach the use of the same conjugates as presently claimed, including the option for the elected species thereof, for each of the 3 elements, AND the same rationale of using a quenching agent to optimize the photosensitizer before activation. See entire document, especially para's:

[0036] FIG. 2A illustrates another embodiment of the invention which uses antibodies as both the first and second binding agents. Analyte (200) is bound by first binding agent (204) having photosensitizer (PS.sub.1) and second binding agent (202) that has an electrophoretic tag consisting of a second photosensitizer (PS.sub.2) and mobility modifying mojety (M.sub.k). Second binding agent also has guencher (Q) adjacent to and guenching photosensitizer (PS.sub.2). Adjacent quencher (Q) prevents PS.sub.2 from being photoactivated to produce singlet oxygen, which in the unbound state (208) would result in self-cleavage and lead to spurious assay results. That is, PS.sub.2 is in an inactive state when adjacent to the quencher. When within effective proximity (206) of PS.sub.1, cTag (212) is cleaved, after which it is separated and activated as shown in FIG. 1B. FIG. 2B illustrates a similar assay configuration wherein the first (218) and second (224) binding agents are oligonucleotides. Another embodiment involving nucleic acid analytes and binding agents is illustrated in FIG. 2D. Spurious activation of unbound photosensitizer (PS) is prevented by quencher (Q) which is held adjacent to photosensitizer (PS) by hairpin (252). When hairpin (252) hybridizes (256) to analyte (254) in a "tagman" type of assay, a polymerase (258) having 5'.fwdarw.3' exonuclease activity cleaves the cTag, which consists of photosensitizer (PS), mobility modifying moiety (M), and a portion of digested hairpin (252). In accordance with such assay, the method provides: (a) contacting a sample comprising single-stranded nucleic acids (254) with an oligonucleotide (252) containing a sequence complementary to a region of the target nucleic acid and a labeled oligonucleotide containing a sequence complementary to a second region of the same target nucleic acid sequence strand, but not including the nucleic acid sequence defined by the first oligonucleotide, to create a mixture of duplexes during hybridization conditions, wherein the duplexes comprise the target nucleic acid annealed to the first oligonucleotide and to the labeled oligonucleotide such that the 3' end of the first oligonucleotide is upstream of the 5' end of the labeled oligonucleotide: (b) maintaining the mixture of step (a) with a template-dependent nucleic acid polymerase having a 5' to 3' nuclease activity under conditions sufficient to permit the 5' to 3' nuclease activity of the polymerase to cleave the annealed, labeled oligonucleotide and release cTags; and (c) detecting and/or measuring the released of cTags.

Application/Control Number: 10/517,569

Art Unit: 1654

Detail Description Paragraph - DETX (44):

[0051] In one aspect, particularly when analytes are polynucleotides, a cleavage-inducing mojety may be an enzyme, such as cleavase, or a DNA polymerase with 5'.fwdarw.3' nuclease activity. In another aspect, particularly when analytes are proteins and binding agents are antibodies, a cleavage-inducing moiety is a group that produces an active species that is capable of cleaving a cleavable linkage, preferably by oxidation. Preferably, the active species is a chemical species that exhibits short-lived activity so that its cleavage-inducing effects are only in the proximity of the site of its generation. Either the active species is inherently short lived, so that it will not create significant background because beyond the proximity of its creation, or a scavenger is employed that efficiently scavenges the active species, so that it is not available to react with cleavable linkages beyond a short distance from the site of its generation. Illustrative active species include singlet oxygen, hydrogen peroxide, NADH, and hydroxyl radicals, phenoxy radical, superoxide, and the like. Illustrative quenchers for active species that cause oxidation include polyenes, carotenoids, vitamin E, vitamin C, amino acid-pyrrole N-conjugates of tyrosine, histidine, and glutathione, and the like, e.g. Beutner et al, Meth. Enzymol., 319: 226-241 (2000).

Detail Description Paragraph - DETX (75):

[0080] In the invention, photosensitizers are preferred as both cleavage-inducing moieties and signal amplification moieties. More preferably, a first photosensitizer acts as a cleavage-inducing moiety to release an electrophoretic tag that itself includes a second photosensitizer in inactivated form, either being held adjacent to a quencher or being chemically inactive until an oxidizing reaction converts it into an active form.

Table 1: Photosensitizer option as Chlorin.

It would have been obvious to one of ordinary skill in the art to have arrived at the present invention of products (conjugates) and methods of using said conjugate of:

- 1) flourophore or photosensitizer (CHLORIN); bound to any agent that function as a
- 2) quenching agent (BETA CAROTENE/CAROTENOID); bound to any agent that can

function as a

3) targeting moiety (ANTIBODY);

Art Unit: 1654

in Singh, because Singh et al. advantageously teaches a conjugate that functions better when a quenching agent is attached to the photosensitizer, which is attached to an antibody; for the same purpose of Applicant's claimed invention of quenching the photosensitizer until the targeting moiety is bound to it's target, whereupon the effect natural/inherent physiological separation/moving away of the quenching agent from the photosensitizer, enabling activation of the photosensitizer upon irradiation with light of a suitable wavelength. And further expounds, like Applicant's myriad examples of each of the 3 conjugated elements each of the 3 elected compounds:

- 1) flourophore or photosensitizer (CHLORIN); bound to any agent that function as a
- quenching agent (BETA CAROTENE/CAROTENOID); bound to any agent that can function as a
 - 3) targeting moiety (ANTIBODY).

Singh teach that such conjugates may be used for known uses (e.g. assays, target-binding by antibody and known uses thereof in diagnostic/therapeutic effects) of said photosensitizer bound targeting moeities.

The judicious selection of the elected species would have been merely a matter of routine selection by one of ordinary skill in the art, based on Singh's express teaching and contemplation of each of the species within their respective genus.

Likewise, the judicious selection by the skilled artisan of means for binding the conjugate components and the addition of other agents with the conjugate would have been merely a matter of routine optimization, depending on the desired effect, absent evidence to the contrary of some unexpected result thereof – which was not found in the present description, as these are merely

Art Unit: 1654

ancillary aspects of the invention's intent, which Singh appears to hit on in the same fashion; namely the addition of a quenching agent to ontimize photosensitizer results.

From the teachings of the references, it is apparent that one of ordinary skill in the art would have had a reasonable expectation of success in producing the claimed invention.

Therefore, the invention as a whole was prima facie obvious to one of ordinary skill in the art at the time the invention was made, as evidenced by the reference, especially in the absence of evidence to the contrary.

Conclusion

No claims are allowed.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to MAURY AUDET whose telephone number is (571)272-0960. The examiner can normally be reached on M-Th. 7AM-5:30PM (10 Hrs.).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Cecilia Tsang can be reached 571-272-0562. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
